Excerpt: ... STORAGE OF COAL. Several reasons for the storage of coal in Arkansas have been given on page 324. Besides these, it is quite essential to store coal at Spadra and Russellville in order to prevent the complete loss of the market, because of inability to deliver coal when it is ordered. In the Transactions of the American Institute of Mining Engineers, volume 42, page 314, R. V. Norris has given all possible data upon the storage of anthracite coal in the air, and the discussion need not be repeated. He strongly recommends mechanically operated plants, designed especially to reduce the breaking of the coal. This breaking causes a heavy loss, even with the hard Pennsylvania anthracite coal, and will be worse with the softer semi-anthracite coal of Spadra and Clarksville. Breakage is especially severe if the coal is dropped any distance, or if it is drawn from the bottom of a high pile while it is under pressure. Freezing need not be feared in Arkansas. A few of the softer coals of Arkansas can be safely stored in the same way, but, with most of them, there is danger of spontaneous combustion or of falling to slack, and the larger sizes at least must be stored under water. All tests show that no noticeable changes occur in coal under water and the only loss will be breakage in handling. The chief objection to storing coal under water in most places is the annoyance of frost, which interferes with reloading and with unloading of wet coal from the railroad cars. The mild climate of Arkansas obviates the first difficulty and if the work is properly done, the coal will be drained before it freezes in cars sent north. By dropping the coal into water, the main source of breakage is avoided. If any mechanical plant is used for reloading, the shoveling types working from th...
